Our platform pricing: simple, per user, and lower as we grow

We charge one simple price per active user each month, based on their role. Up to 100 users, our price stays the same for every role. As our platform grows beyond that, we lower the price for everyone, except contractors (we explain why below).

Role	1–100 users	101–250	251–500	501+
Super admin / Admin / Agent	**$3.50**	$3.25	$3.00	$2.75
Finance / Content	**$2.00**	$1.85	$1.70	$1.50
Affiliate / Sub-affiliate	**$3.00**	$2.75	$2.50	$2.25
Homeowner (client)	**$2.50**	$2.25	$2.00	$1.75
Contractor	$3.50	$3.75	$4.00	$4.50

Prices are in USD per active user per month. Once our platform reaches the next tier, the new price applies to all our users. Twilio credits (text messages, call minutes, phone numbers and transcripts) are billed separately, based on what we use.

How our price moves as we grow

Why our price goes down

Our shared infrastructure runs every user: serverless API compute and hosting, the managed SQL database (queries and storage), private and public APIs, inbound Twilio voice and SMS webhooks, realtime WebSocket connections, transactional email delivery, authenticated MCP endpoints for AI assistants, scheduled jobs, and file storage. Most of this is fixed platform capacity, so as more users share it, each user's portion of the compute, database load and API traffic goes down. That's why every role gets cheaper after 100 users.

Why contractors go up

Contractors are our only role whose storage footprint grows month over month. Every project adds progress photos, site evidence, draw-request documents and prequalification files, uploaded through our API, validated server-side, and retained in object storage (public and private, encrypted at rest, served through signed URLs) for the life of the project. Each file is then read many times by homeowners, staff and affiliates, adding CDN data transfer, API reads and database records. Storage accumulates, so as we grow, each contractor costs more to store and serve.
